Mohammad Saghir Khan This book provides a comprehensive description of phosphate solubilizing microorganisms and highlights methods for the use of microphos in different crop production systems. The focus is on understanding both the basic and applied aspects of phosphate solubilizing microorganisms and how phosphorus-deficient soils can be transformed into phosphorus-rich ones by applying phosphate solubilizing microorganisms. The interaction of rhizosphere phosphate solubilizing microorganisms and environmental variables, as well as their importance in the production of crops such as legumes, cereals, vegetables etc. are discussed and considered. The use of cold-tolerant phosphate solubilizing microorganisms to enhance crop productivity in mountainous regions is examined, as are the ecological diversity and biotechnological implications of phosphate solubilizing microorganisms.

Physiologists have to certainly sort out the insufficiency of consequential researches, genuinely required for getting higher productivity, opulence and sustainability of agriculture through outstandingly promising technologies to help improvement in metabolic boundaries necessitates mainly for abiotic stress factors. The aspiration is to make stronger the vital outcome of conscientious research coupled principally with thorough perceptions of underlying mechanisms of plant tolerance under changing environments. Nevertheless, appropriate strategies by relevant ideas of paramount importance could ensure food production under extremes of stressful conditions geographically varying from one place to another. The book entitled *Plant Abiotic Stresses: Physiological Mechanisms, Tools and Regulation* has substance for extending simple and applied researches for their rapid applications in agriculture besides broadening knowledge of the abiotic stress science far and beyond. On the other hand,

with loo ming third decade, stress physiology research has almost surpassed the fundamentals globally and has been entirely intriguing to scrutinize the physiological and molecular bases of plant stress tolerance. At this decisive point in time, hopefully, this book, in part, could be a step forward in providing enough insight on stress causing multiple environmental components and to obtain favourable directions in several ways. All possible research initiatives have been sensibly included in exceptionally well written chapters by genuinely dedicated eminent contributors with a view to organize the burning theme of the present scenario being acknowledged resolutely by the world scientists.

agricultural censuses to be undertaken between 2016 and 2025. The census of agriculture continues to play a key role in the collection of structural data on the agriculture sector. The WCA 2020 will ensure that data collected are comparable at the international level while also addressing emerging information needs of the 21st century. Four modalities for conducting a census of agriculture are envisaged: the classical (one-off) approach, which is still widely used; the modular approach, which was introduced in the WCA 2010; the integrated census/survey modality, involving rotating survey modules over the years between two censuses; and the combined census modality, which uses administrative data. The concept of 'essential' items is re-introduced and 'frame' items are now separately identified for those countries wishing to adopt the modular approach or follow-up surveys. The programme emphasizes the benefits of the

2015-01-01 O.C. Bockman The present book provides factual information about the environmental aspects of modern agriculture, with an emphasis on the issues relating to fertilizer use. The information is drawn from the scientific literature and the text has been reviewed by scientist at universities and independent research institutes. It is firm conviction that fertilizer, when properly used, is an environmentally benign product which is indispensable in agriculture s task of feeding the worlds population. The material presented in this book substantiates this conviction. It is hope that this book will contribute to a better understanding of the complexities of agriculture, and will be of value in future discussion of regulation and changes of practice.

and their potential biotechnological application for plant growth, crop yield, and soil health under the natural as well as harsh environmental conditions for sustainable agriculture. The microbes are ubiquitous in nature. The soil is a natural hotspot of the soil microbiome. The soil microbiome plays a critical role in the maintenance of global nutrient balance and ecosystem functioning. The soil microbiomes are associated with plant ecosystems through the intense network of plant-microbe interactions. The microbes present in bulk soil move toward the rhizospheric region due to the release of different nutrients by plant systems. The rhizospheric microbes may survive or proliferate in rhizospheric zone depending on the extent of influences of the chemicals secreted into the soil by roots. The root exudates contain the principal nutrients factors (amino acids, glucose, fructose, and sucrose). The microbes present in rhizospheric region have capabilities

atmospheric nitrogen, produce different phytohormones, and solubilize phosphorus, potassium, and zinc. The plant systems take these nutrients for their growth and developments. These soil and plant associated microbes also play an important role in protection of plants from different plant pathogenic organisms by producing different secondary metabolites such as ammonia, hydrogen cyanide, siderophores, and hydrolytic enzymes. The soil microbiomes with plant growth-promoting (PGP) attributes have emerged as an important and promising tool for sustainable agriculture. The soil microbiomes promote the plant growth and enhance the crop yield and soil fertility via directly or indirectly different plant growth-promoting mechanism. The soil microbes help the plant for adaptation in extreme habitats by mitigating the abiotic stress of high/low temperatures, hypersalinity, drought, and acidic/alkaline soil. New Processes for Nutrient Recovery from Wastes
2019-12-09 Matias B. Vanotti Global demand for mineral fertilizers is continuously increasing, while large amounts of organic wastes are being disposed without use as a resource, resulting in soil, water and air pollution. Current trends of intensification, expansion and agglomeration of livestock production result in a net import of nutrients that lead to a surplus in some production areas. Therefore, new processes and technologies to recover and re-use nutrients from both solid and liquid wastes are desirable to close the loop on the nutrient cycle in modern human society and address future scarcity of non-renewable nutrients.
