The Creation of Markets for Ecosystem Services in the United States

2016-11-01 Mattijs van Maasakkers The Creation of Markets for Ecosystem Services in the United States is a detailed analysis of the most advanced efforts to create markets for ecosystem services in the United States. With the help of in-depth case studies of three well-known attempts to create such markets--in the Chesapeake Bay watershed, the Ohio River basin and the Willamette River basin--the book explains why very few of these markets have actually succeeded even after close to two decades of much scholarly enthusiasm, significant federal funding and concerted efforts by NGOs, government agencies and private businesses. Based on interviews, policy analysis and participatory observation, three features of markets for ecosystem services emerge as particularly problematic. First, the logic of displacement or the idea that particular elements of an ecosystem can be separated and traded across landscapes or watersheds runs counter to political interests, environmental beliefs and people's connections to specific places. The second problem is that of measurement. Quantification methods embed a range of often contentious assumptions and decisions about what counts when restoring ecosystems. The third problem is related to participation in environmental decision-making.

Econometric Analysis of Cross Section and Panel Data, second edition

2010-10-01 Jeffrey M. Wooldridge The second edition of a comprehensive state-of-the-art graduate level text on microeconomic methods, substantially revised and updated. The second edition of this acclaimed graduate text provides a unified treatment of two methods used in contemporary econometric research, cross section and data panel methods. By focusing on assumptions that can be given behavioral content, the book maintains an appropriate level of rigor while emphasizing intuitive thinking. The analysis covers both linear and nonlinear models, including models with dynamics and/or individual heterogeneity. In addition to general estimation frameworks (particular methods of moments and maximum likelihood), specific linear and nonlinear methods are covered in detail, including probit and logit models and their multivariate, Tobit models, models for count data, censored and missing data schemes, causal (or treatment) effects, and duration analysis. Econometric Analysis of Cross Section and Panel Data was the first graduate

econometrics text to focus on microeconomic data structures, allowing assumptions to be separated into population and sampling assumptions. This second edition has been substantially updated and revised. Improvements include a broader class of models for missing data problems; more detailed treatment of cluster problems, an important topic for empirical researchers; expanded discussion of "generalized instrumental variables" (GIV) estimation; new coverage (based on the author's own recent research) of inverse probability weighting; a more complete framework for estimating treatment effects with panel data, and a firmly established link between econometric approaches to nonlinear panel data and the "generalized estimating equation" literature popular in statistics and other fields. New attention is given to explaining when particular econometric methods can be applied; the goal is not only to tell readers what does work, but why certain "obvious" procedures do not. The numerous included exercises, both theoretical and computer-based, allow the reader to extend methods covered in the text and discover new insights.

Chapter 4 of Holt Chemistry, titled "Periodic Table", provides a thorough overview of the table of elements and its constituents. The chapter opens with a conversation on the characteristics of groupings and periodic groups, clarifying how Russian chemist Dmitri Mendeleev ordered elements by their atomic weight in ascending order¹. It then delves into the concept of outer electrons and levels of energy of atoms, highlighting the part of valence electrons in chemical reactions and changes to atoms and molecules.

The chapter moreover distinguishes between transition elements and main group elements, elaborating on their features and characteristics. It also explains the concept of energy of ionization and its tendencies among groupings and periodic groups on the table of elements¹. The chapter talks about atomic and ionic, and how these can be forecasted based on an atom's place on the table of elements.

Electronegativity, which quantifies an atom's propensity to pull a bonding pair of electrons, is another crucial topic covered in this chapter¹. The chapter finishes with a discussion on the relationship diagonally, metallic character, and point of boiling of components.

In terms of exercises, the chapter provides a array of questions for practice and preparation for tests resources to strengthen the concepts studied. These questions cover a array of topics, from grasping the arrangement of components to studying the trends in the table of elements.
