The chapter starts with a discussion on the characteristics of groups and periodic groups, clarifying how the Russian chemist Mendeleev organized elements by their atomic weight in ascending order¹. It then delves into the concept of outer electrons and energy levels of atoms, underscoring the part of valence electrons in chemical reactions and transformations to atoms and molecules. The chapter further separates between transition metals and main elements, expounding on their characteristics and characteristics. It also describes the notion of energy of ionization and its patterns among groupings and periods on the periodic table¹. The chapter discusses atomic and ionic, and how these can be anticipated based on an element's location on the periodic table. Electronegativity, which quantifies an element's tendency to draw a pair of bonding electrons, is another key topic addressed in this part¹. The chapter concludes with a discussion on the relationship diagonally, character of metals, and boiling point of components.
