The chapter starts with a discussion on the properties of groups and periodic groups, elucidating how the Russian chemist Mendeleev arranged elements by their atomic weight in increasing order1. It then explores the concept of outer electrons and levels of energy of atoms, underscoring the function of these electrons in chemical reactions and changes to atoms and molecular structures.

The chapter further differentiates between transition metals and main elements, detailing on their characteristics and traits. It also clarifies the idea of ionization energy and its tendencies among groupings and periodic groups on the table of elements1. The chapter converses about atom's and ionic, and how these can be predicted based on an atom's location on the table of elements.

Electronegativity, which calculates an element's inclination to pull a pair of bonding electrons, is another important subject addressed in this section1. The chapter finishes with a conversation on the diagonal relationship, character of metals, and boiling point of elements.

In terms of exercises, the chapter provides a variety of questions for practice and preparation for tests materials to reinforce the concepts studied. These questions cover a range of themes, from grasping the organization of components to studying the patterns in the periodic table.
