The book “Analyzing Casual Conversation” by Suzanne Eggins and Diana Slade, originally published in 1997, creates a methodical model for the examination and depiction of casual conversation in English. The scholars assert that despite its occasionally aimless look and ostensibly unstructured substance, casual conversation is a highly structured task and performs a crucial part in the social construction of reality. The book proceeds through authentic samples of casual conversations involving participants varying in age, gender, ethnicity, and socio-economic class<sup>12</sup>. Drawing on perspectives from sociology, linguistics, and critical semiotics, the publication equips readers with the analytic skills to describe the layers of structure and critical interpretive models to clarify the ‘social work’ that happens on through chat.

Engineering Economics and Cost Estimation is a essential aspect of any engineering project. It involves current and upcoming economic factors, making it essential to obtain reliable estimates of future costs, benefits, and other economic parameters. Engineers frequently deal with projects whose scale, complexity, and uncertainty call for complex approaches to planning and budgeting<sup>[1]</sup>. Several methods are used for cost estimation, including rough estimates, semi-detailed estimates, or detailed estimates, depending on the needs for the estimates<sup>[2]</sup>. Key concepts in this field include overhead costs, cost driver identification, cost allocation methods, capital budgeting, flexible budgeting, zero-based budgeting, budgets, and estimates. Several models are available for developing cost (or benefit) estimates, such as the per-unit model, the segmenting model, cost indexes, the power-sizing model, and learning curve cost estimating. The quality of a cost estimate generally increases as the resources allocated to developing the estimate increase.
