Ethiopia Health Extension Program Huihui Wang 2016-04-25 As a low-income country, Ethiopia has made impressive progress in improving health outcomes. This report examines how Ethiopia's Health Extension Program (HEP) has contributed to the country's move toward Universal Health Coverage (UHC), and to shed light on how other countries may learn from Ethiopia's experiences of HEP when designing their own path to UHC. HEP is one of the government's UHC strategies introduced in a context of limited resources and low coverage of essential health services. The key aspects of the program include the capacity building and mobilization of more than 30, 000 Health Extension Workers (HEWs) targeting more than 12

million model families, and the mobilization of health development army ? to support the community-based health system. Using the HEP-UHC conceptual model and data from Demographic and Health Surveys, the study examines how the HEP has contributed to the country's move toward UHC. During the period that the HEP has been implemented, the country has experienced significant improvements in many dimensions: in terms of socioeconomic, psychological, behavioral, and biological dimensions of the beneficiaries; and in terms of the coverage of health care services. The study finds an accelerated rate of improvements among the rural, less-educated, and the poor population, which is leading to an overall reduction in equity gaps and improvements in the equity indicators including the concentration indices - that suggest a more equitable distribution of resources and health outcomes. The HEP in Ethiopia has demonstrated that an institutionalized community approach is effective in helping a country make progress toward UHC. The elements of success in the HEP include the emphasis on community mobilization which identifies community priorities, engages and empowers community members, and supports their ability to solve local problems. The other aspect of HEP is the emphasis on institutionalization of the activities, which addresses the sustainability of community programs through high level of political commitment, and effective coordination of national policies and leveraging of support from partners. These findings may offer useful lessons for other low income countries facing similar challenges in developing and implementing a sustainable UHC strategy.

of medicines is a wide and rapidly evolving concept and practice, following a medicine throughout its lifecycle, from first administration in humans through clinical studies and then marketing in the patient population at large. Previous reports from CIOMS I - VIII provided practical guidance in some essential components of risk management such as terminology and reporting of adverse drug reactions, management of safety information from clinical trials, and safety signal detection. Beyond the detection, identification, and characterization of risk, "risk minimization" is used as an umbrella term for the prevention or mitigation of an undesirable outcome. Risk management always includes tools for "routine risk minimization" such as product information, the format depending on the jurisdiction, to inform the patient and the prescriber, all of which serve to prevent or mitigate adverse effects. Until this current CIOMS IX document, limited guidance has been available on how to determine which risks need "additional risk minimization," select the appropriate tools, apply and implement such tools globally and locally, and measure if they are effective and valuable. Included in the report is a CIOMS framework for the evaluation of effectiveness of risk minimization, a discussion of future trends and developments, an annex specifically addressing vaccines, and examples from real life.
