**Occupational Safety and Health Guidance Manual for Hazardous Waste Site Activities** 1991-11

Patty's Industrial Hygiene, VII: Specialty Areas and Allied Professions Robert L. Harris 2000-03-27 The standard reference in occupational health and safety for over 50 years, the new Patty's presents for the first time a separation of industrial hygiene and toxicology topics, offering complete reorganization of the material into four volumes of clearly defined topic areas.

Clandestine Methamphetamine Laboratory Assessment and Remediation Guidance American Industrial Hygiene Association 2007  
Issues in Risk Assessment National Research Council 1993-02-01 The scientific basis, inference assumptions, regulatory uses, and research needs in risk assessment are considered in this two-part volume. The first part, Use of Maximum Tolerated Dose in Animal Bioassays for Carcinogenicity, focuses on whether the maximum tolerated dose should continue to be used in carcinogenesis bioassays. The committee considers several options for modifying current bioassay procedures. The second part, Two-Stage Models of Carcinogenesis, stems from efforts to identify improved means of cancer risk assessment that have resulted in the development of a mathematical dose-response model based on a paradigm for the biologic phenomena thought to be associated with carcinogenesis.

WHO Guidelines for Indoor Air Quality 2010 This book presents WHO guidelines for the protection of public health from risks due to a number of chemicals commonly present in indoor air. The substances considered in this review, i.e.

benzene, carbon monoxide, formaldehyde, naphthalene, nitrogen dioxide, polycyclic aromatic hydrocarbons (especially benzo[a]pyrene), radon, trichloroethylene and tetrachloroethylene, have indoor sources, are known in respect of their hazardousness to health and are often found indoors in concentrations of health concern. The guidelines are targeted at public health professionals involved in preventing health risks of environmental exposures, as well as specialists and authorities involved in the design and use of buildings, indoor materials and products. They provide a scientific basis for legally enforceable standards.

Prudent Practices in the Laboratory National Research Council 2011-03-25 Prudent Practices in the Laboratory--the book that has served for decades as the standard for chemical laboratory safety practice--now features updates and new topics. This revised edition has an expanded chapter on chemical management and delves into new areas, such as nanotechnology, laboratory security, and emergency planning. Developed by experts from academia and industry, with specialties in such areas as chemical sciences, pollution prevention, and laboratory safety, Prudent Practices in the Laboratory provides guidance on planning procedures for the handling, storage, and disposal of chemicals. The book

offers prudent practices designed to promote safety and includes practical information on assessing hazards, managing chemicals, disposing of wastes, and more. Prudent Practices in the Laboratory will continue to serve as the leading source of chemical safety guidelines for people working with laboratory chemicals: research chemists, technicians, safety officers, educators, and students.

**DDT, Lindane, and 2,4-D** IARC Working Group on the Evaluation of Carcinogenic Risks to Humans 2018-07-27 This volume of the IARC Monographs provides evaluations of the carcinogenicity of DDT and lindane (both organochlorine insecticides), and 2,4-D (a chlorophenoxy herbicide). DDT is one of the most studied chemicals of environmental concern. It came into widespread use for disease-vector control and agriculture in the 1940s and was an important tool in malaria eradication efforts. Most uses of DDT were subsequently restricted because of its persistence and adverse environmental effects. Nevertheless, it is still detectable in the environment, in food, and in the blood and adipose tissue of humans and animals. Lindane was commercialized as an agricultural insecticide during the same period as DDT and is now largely banned due to its toxicity. Since its introduction in the 1940s, 2,4-D has become one of the most widely used herbicide active ingredients worldwide. It is still used in significant quantities, primarily in agriculture, including in mixtures with other active ingredients.

**Emergency and Continuous Exposure Guidance Levels for Selected Submarine Contaminants** National Research Council

2008-05-09 U.S. Navy personnel who work on submarines are in an enclosed and isolated environment for days or weeks at a time when at sea. To protect workers from potential adverse health effects due to those conditions, the U.S. Navy has established exposure guidance levels for a number of contaminants. In this latest report in a series, the Navy asked the National Research Council (NRC) to review, and develop when necessary, exposure guidance levels for 11 contaminants. The report recommends exposure levels for hydrogen that are lower than current Navy guidelines. For all other contaminants (except for two for which there are insufficient data), recommended levels are similar to or slightly higher than those proposed by the Navy. The report finds that, overall, there is very little exposure data available on the submarine environment and echoes recommendations from earlier NRC reports to expand exposure monitoring in submarines.

**Long-Term Health Effects of Participation in Project SHAD (Shipboard Hazard and Defense)** Institute of Medicine 2007-08-03 More than 5,800 military personnel, mostly Navy personnel and Marines, participated in a series of tests of U.S. warship vulnerability to biological and chemical warfare agents, Project SHAD (Shipboard Hazard and Defense), in the period 1962-1973. Only some of the involved military personnel were aware of these tests at the time. Many of these tests used simulants, substances with the physical properties of a chemical or biological warfare agent, thought at the time to have been harmless. The existence of these tests did not come to light until many decades later. In September 2002, the Institute of Medicine (IOM) agreed to undertake a scientific study, funded by the Veterans' Affairs, of potential long-term health effects of participation in Project SHAD. In general, there was no difference in all-cause mortality between Project SHAD participants and nonparticipant controls, although participants statistically had a significantly higher risk of death due to heart disease, had higher levels of neurodegenerative medical conditions and higher rates of symptoms with no medical basis. Long-Term Health Effects of Participation in Project SHAD focuses on the potential health effects of participation in Project SHAD. It is a useful resource for government defense agencies, scientists and health professionals.

Reuben 2010-10 Though overall cancer incidence and mortality have continued to decline in recent years, cancer continues to devastate the lives of far too many Americans. In 2009 alone, 1.5 million American men, women, and children were diagnosed with cancer, and 562,000 died from the disease. There is a growing body of evidence linking environmental exposures to cancer. The Pres. Cancer Panel dedicated its 2008&2009 activities to examining the impact of environmental factors on cancer risk. The Panel considered industrial, occupational, and agricultural exposures as well as exposures related to medical practice, military activities, modern lifestyles, and natural sources. This report presents the Panel's recommend. to mitigate or eliminate these barriers. Illus.

**Acute Exposure Guideline Levels for Selected Airborne Chemicals** National Research Council 2012-12-28 At the request of the Department of Defense and the Environmental Protection Agency, the National Research Council has reviewed the relevant scientific literature compiled by an expert panel and established Acute Exposure Guideline Levels (AEGs) for several chemicals. AEGs represent exposure levels below which adverse health effects are not likely to occur and are useful in responding to emergencies, such as accidental or intentional chemical releases in community, workplace,

transportation, and military settings, and for the remediation of contaminated sites. Three AEGs are approved for each chemical, representing exposure levels that result in: 1) notable but reversible discomfort; 2) long-lasting health effects; and 3) life-threatening health impacts. Acute Exposure Guideline Levels for Selected Airborne Chemicals: Volume 13 includes AEGs for boron trifluoride, bromoacetone, chloroacetone, hexafluoroacetone, perchloryl fluoride, piperidine, propargyl alcohol, trimethoxysilane and tetramethoxysilane, and trimethylbenzenes.

**NIOSH Recommendations for Occupational Safety and Health** DIANE Publishing Company 1992-04 A comprehensive list of NIOSH documents that contain recommendations for safety and health standards in the workplace. Includes documents containing recommendations for chemical, physical, and other hazards in the workplace. Also includes adverse health effects for the chemical and physical hazards. Five appendices contain information about classes of chemicals and other data. Subject index.

**Emergency and Continuous Exposure Guidance Levels for Selected Submarine Contaminants** National Research Council 2009-10-21 U.S. Navy personnel who work on submarines are in an enclosed and isolated environment for days or weeks at a time when at sea. Unlike a typical work environment, they are potentially exposed to air contaminants 24 hours a day. To protect workers from potential adverse health effects due to those conditions, the U.S. Navy has established exposure guidance levels for a number of contaminants. The Navy asked a subcommittee of the National Research Council (NRC) to review, and develop when necessary, exposure guidance levels for specific contaminants. This volume, the third in a series, recommends 1-hour and 24-hour emergency exposure guidance levels (EAGs) and 90-day continuous exposure guidance levels (CEGLs) for acetaldehyde, hydrogen chloride, hydrogen fluoride, hydrogen sulfide, and propylene glycol dinitrate.
