Bioenergy for Sustainable Development in Africa

2011-11-03 Rainer Janssen The work builds on the results of the COMPETE Bioenergy Competence Platform for Africa, which was supported by the European Commission and coordinated by WIP Renewable Energies, Germany. The five sections cover biomass production and use, biomass technologies and markets in Africa, biomass policies, sustainability, and financial and socio-economic issues. This valuable work is, in effect, a single-source treatment of a key energy sector in a part of the world which still has a lot of unrealised potential for development.

Technology Transfer for Renewable Energy

2010-09-23 Gill Wilkins This text highlights the role that renewable energy can play in achieving sustainable development. It focuses on rural areas of developing countries, looking in particular at stand-alone solar home systems and grid-connected biomass cogeneration plants. It analyzes the main barriers to the successful transfer of renewable energy technology, with case studies from a range of South-East Asian, South Asian, Pacific and African countries, and explains the ways in which these obstacles can be overcome. The roles of the key players involved and how the Kyoto Protocol can facilitate the transfer in order to mitigate climate change are also discussed.

Biofuels and the Sustainability Challenge

2013 Aziz Elbehri Biofuels global emergence in the last two decades is met with increased concerns over climate change and sustainable development. This report addresses the core issue of biofuel sustainability of biofuels and related feedstocks, drawing from a wide range of sustainability related studies, reports, policy initiatives. The report critically examines the economic, environmental and social sustainability dimensions of biofuels and review the major certification initiatives, schemes and regulations. In doing so, the report relies on extensive review of a number of country case studies covering a broad range of current biofuel-feedstocks systems. The report analysis clearly distinguish feedstock efficiency (in terms of biofuel yields per unit of land) from sustainability, especially under limiting resource (irrigated water) or sensitive areas (carbon stocks). Also, long run economic viability depend on the future policy support, technical innovations in biofuel systems, economics of biofuel supply and demand and trade-offs between food and energy uses as well as feedstock productivity gains. Biofuels can present both advantages and risks for environmental sustainability; the latter being often difficult to measure or monitor and may conflict with economic sustainability unless great strides in productivity gains are achieved. Social sustainability is the weakest link in current biofuel certification schemes owing to intrinsic local factors and as efforts target more few negative social impacts; much less focus is placed on inclusive processes that strengthen marginal stockholders participation and benefits. Biofuel certification schemes need to be more smallholder inclusive, perhaps through policy initiatives. Finally, poor developing countries, especially with abundant land and biomass production potential, need to prioritise food security and poverty reduction. In many cases, biofuel models that encourage small scale integrated bioenergy systems may offer higher rural development

impacts. FDI-induced larger-scale biofuel projects, on the other hand, may be suitable in those situations where countries have sufficient industrial capacity, besides land and biomass potential, and when these biofuel projects can be fully integrated into domestic energy strategies that do not conflict with food production potential and food security.

Assessing the Potential for Biomass Energy Development in South Carolina

2009 Roger C. Conner An assessment of the potential for developing a sustainable biomass energy industry in South Carolina was conducted. Biomass as defined by Forest Inventory and Analysis is the aboveground dry weight of wood in the bole and limbs of live trees [greater or equal to] 1-inch diameter at breast height, and excludes tree foliage, seedlings, and understory vegetation. Several possible sources of biomass were analyzed: unutilized logging residue and standing residual inventory trees on acres with tree harvesting; commercial thinning; precommercial thinning on overstocked natural sapling-seedling stands; mill residue; and urban wood waste. A range of prices from \$20 to \$30 per ton was established by surveys sent to South Carolina's timber producers. Prices reflect 2008 market conditions. The estimates of potential biomass distributed across these price points rose from 4.8 million tons to a total of 16.5 million tons annually. Nearly 7.7 million tons are currently being utilized. New facilities that use wood to produce energy could capitalize on the 8.8 million annual tons of unutilized biomass and operate without overly impacting existing forest industries or increasing harvest levels above 2006 estimates.

Sustainable Bioenergy Production - An Integrated Approach

2013-06-19 Hans Ruppert This book focuses primarily on the advantages and implications of sustainable bioenergy production in terms of ensuring a more sustainable world despite its growing energy demands. It addresses a new concept that focuses on the interactions between different uses of agricultural land (for example, agriculture for food, forage or energy and nature conservation) and their ecological, economic and societal impacts. This research concept provides new insights into the competition for resources and the synergies between different land uses. This book seeks to improve people's understanding of bioenergy's potentials for the future. It will be of interest not only to those involved in sustainable energy, but also to environmental planners, agriculture and soil specialists, and environmental policy-makers.

Sugarcane Bioenergy for Sustainable Development

2018-10-25 Luis A. B. Cortez In recent years, there has been a rapid expansion of the growing of crops for use in bioenergy production rather than for food. This has been particularly the case for sugarcane in Latin America and Africa. This book examines the further potential in the context of the food versus fuel debate, and as a strategy for sustainable development. Detailed case studies of two countries, Colombia and Mozambique, are presented. These address the key issues such as the balance between food security and energy security, rural and land development policies, and feasibility and production models for expanding bioenergy. The authors then assess these issues in the context of broader sustainable development strategies, including implications for economics, employment generation, and the environment. The book will be of great interest to researchers and professionals in energy and agricultural development.

Biomass and Agriculture

2004-09-13 Organisation for Economic Co-operation and Development Agricultural Biomass is organic material produced directly from agricultural activities, including cereal grains, sugar crops, oilseeds and other arable crops, along with straw, and also livestock by-products, such as manure and animal fat, resulting in the production of bioenergy and biomaterials. This OECD Workshop examines the potential of developing energy and materials produced from the agricultural biomass, that may act as a replacement for fossil fuels. The Workshop discussed whether agriculture could become a valuable source of bioenergy and biomaterials as well as food and fibres. Can the agricultural biomass be integrated into policies of sustainable development? What policies should be developed by governments to expand and develop this market? The Workshop concluded that countries need to weigh the cost and benefits of adopting such an approach, considering the effect on farmers and the environment. That any policy strategies for biomass development should focus on demand, as opposed to supply.

Bioenergy - Realizing the Potential

2005-07-14 Dr. Semida Silveira Modern bioenergy has gained increased attention in the past decade. Not only does it provide an effective option for the provision of energy services from the technical point of view, but it is based on resources that can be utilized on a sustainable basis all around the globe. In addition, the benefits accrued go beyond energy provision, creating unique opportunities for regional development. Today, biomass is seen as one of the most promising renewable sources of modern energy services in the medium term. Know-how and experiences from different countries pave the way to further development of bioenergy systems. Bioenergy: Realising the Potential integrates the key technical, policy and economic issues surrounding bioenergy projects in industrialised and developing countries, with a critical focus on four major topics: • The biomass resource availability and potential • The institutions and markets development • Technical and economic enhancements • Successful examples from Europe and developing countries

potential of sustainable biomass production in developing-Chapter 4 of Holt Chemistry, titled "Periodic Table", provides a thorough overview of the periodic table and its constituents. The chapter begins with a conversation on the characteristics of groups and periods, clarifying how the Russian chemist Mendeleev organized elements by their weight in increasing order¹. It then dives into the idea of valence electrons and levels of energy of atoms, emphasizing the part of valence electrons in chemical reactions and transformations to atoms and molecular structures.

The chapter further separates between transition metals and main elements, expounding on their characteristics and traits. It also clarifies the idea of energy of ionization and its tendencies among groupings and periods on the periodic table¹. The chapter converses about atom's and radii, and how these can be predicted based on an atom's place on the table of elements.

Electronegativity, which measures an element's propensity to draw a bonding pair of electrons, is another important subject discussed in this part¹. The chapter ends with a dialogue on the diagonal relationship, metallic character, and boiling point of elements.

In terms of questions, the chapter provides a array of questions and test preparation resources to reinforce the ideas learned. These exercises cover a array of themes, from understanding the order of constituents to exploring the patterns in the periodic table.
