Specific Techniques for the Psychotherapy of Schizophrenic Patients

1996 Andrew Lotterman "This valuable book presents a detailed method for psychotherapy with schizophrenic patients. Unlike much of the previous work on psychotherapy with schizophrenic patients, which has not focused on specific techniques, this volume concentrates on the particular details of working psychologically with patients who have such psychotic symptoms as hallucinations, delusions, paranoid ideas, ideas of reference, looseness of association, and pressured speech." "Dr. Lotterman clearly describes a technical approach that addresses what is psychologically unique about schizophrenic patients. Dr. Lotterman presents his view of the structure of the mind in schizophrenic patients and explains how that structure differs from that seen in neurotic and borderline patients. He then shows how psychotherapy technique should be modified in order to address this particular schizophrenic structure. For example, due to a process Dr. Lotterman calls deconceptualization, the schizophrenic's capacity to think in concepts deteriorates. Thoughts and meanings become compressed into sensations or perceptions; the socially shared common language is lost. As a result, schizophrenic patients have few words to describe their inner states, and traditional forms of psychotherapy, which depend so exclusively on the use of language, are robbed of their power. Lotterman suggests several ways to address this specific aspect of schizophrenic psychological structure, so that a more standard form of verbal psychotherapy can develop."--BOOK JACKET.Title Summary field provided by Blackwell North America, Inc. Experiencing Psychosis

2013-03-01 Jim Geekie Extensive scientific research has been conducted into understanding and learning more about psychotic experiences. However, in existing research the voice of subjective experience is rarely taken into consideration. In this book, first-person accounts are brought centre-stage and examined alongside current research to suggest how personal experience can contribute to professional understanding, and therefore the treatment, of psychosis. Experiencing Psychosis brings together a range of contributors who have either experienced psychosis on a personal level or conducted research into the topic. Chapters are presented in pairs providing information from both personal and research perspectives on specific aspects of psychosis including: hearing voices, delusional beliefs, and trauma as well as cultural, existential and spiritual issues. Experts from the field recognise that first and foremost psychosis is a human experience and that those who suffer from psychotic episodes must have some involvement in any genuine attempts to make sense of the experience. This book will be essential reading for all mental health professionals involved with psychosis. The accessible style and compelling personal histories will also attract service users and their families.

Psychotherapy of Schizophrenia

1981 Bertram P. Karon Inevitably, every psychotherapist has some experience with severely disturbed patients. Consequently, they will turn with excitement to this important new book which is a stunning attempt by two knowledgeable, persevering psychotherapists to present their understanding and sound therapeutic approach to these difficult and challenging patients. The authors argue that the treatment of choice is clearly psychotherapy and that such treatment can be successful and as long lasting for schizophrenic patients as it is for neurotic patients, but the journey may be longer and it may take more time to traverse. The task of therapy is to untangle the past from the present to make the future conceivable. The volume provides a thorough historical overview of the theoretical and clinical approaches to the problem of schizophrenia, including the views of leading contemporary clinicians on the topic. In general, the major clinical controversies have been regarded as issues of whether to focus on past, present or future; reality or fantasy; affects; exploration or relationship; whether the therapist should be active or passive; and how to handle regression. The authors argue that these are the wrong issues. They say that the task of therapy is to untangle the past from the present to make the future conceivable. Reality and fantasy are intertwined and must both be dealt with. Affects are central to all therapy, and emphasis on

anger, despair, loneliness, terror, and shame are all necessary, as is the clarification of affect, and the acceptance of positive affect. Activity versus passivity is again in the wrong question; the right one is what action is helpful, when it is helpful, and when is not doing anything helpful? Regression is inevitable; should one accept it fully or try to limit it? This has no general answer other than do what is necessary (i.e., unavoidable) or most helpful to a particular patient at a particular time.

Diagnosis: Schizophrenia

2011 Rachel Miller In this book, thirty-five young, recently diagnosed patients speak about schizophrenia and the process of recovery, while two specialists illuminate the medical science, psychoeducation, and therapeutic needs of those coping with the illness, as well as access to medical benefits and community resources. A remarkably inclusive guide, the volume informs patients, families, friends, and professionals, detailing the possible causes of schizophrenia, medications and side effects, the functioning of the brain, and the value of rehabilitation and other services. In their dialogues, participants confront shame, stigma, substance use, and relapse issues and the necessity of healthy eating, safe sex practices, and coping skills during recovery. Clinicians elaborate on the symptoms of schizophrenia, such as violent and suicidal thoughts, delusions, hallucinations, memory and concentration problems, trouble getting motivated or organized, and anxiety and mood disorders. Adopting an uplifting tone of manageability, the participants, authors, and clinicians of this volume offer more than advice--they prescribe hope.

Symptoms of depression in adolescents are eating disorders, weight change, irritable mood, excessive sleeping in daytime, excessive temper, criminal behavior, memory loss, fatigue, self preoccupation, sadness, difficulty in concentrating, worthlessness feelings, loss of interest, self hatred, obsession with death and thought & attempts of suicides. When these symptoms are being noticed for more than two weeks, it is important to get treatment for the adolescent. Depression not only affects interpersonal relationships, but school performance as well. Depressed adolescents are more prone to take onto drugs and alcohol as an attempt to overcome their depression. Such problems require intensive treatment.

The doctor will take blood test and perform physical examination to determine the cause of depression. The adolescent can also be tested for substance abuse such as smoking, heavy alcohol consumption, marijuana smoking, and usage of other drugs. After the physical examination, psychiatric evaluation is also done to understand the cause of sadness, loss of interest and irritability. Depression can also lead to the development of other psychiatric disorders such as schizophrenia, mania and anxiety. It is also important to determine whether the adolescent poses a risk for himself/herself and others. Family and school personnel can provide valuable information about the adolescent to the doctor. Treatment for depression for adolescent is similar to the treatment of depression for adults. Along with the treatment, the adolescent are given antidepressant medication and psychotherapy. Antidepressant medications include tricyclics, Prozac, selective serotonin reuptake inhibitors or SSRI. Some of the medicines increase the risk, so it is a good idea that parents discuss the possible risks with the doctor. Only some of the antidepressant medications are meant for children and adolescents. Adolescents with severe depression need to be hospitalized as they are more prone to kill themselves.

Instruction psychotherapy for people diagnosed with schizophrenia the-There are basically two types of diabetes that will affect an adolescent. It is type 1 diabetes and type 2 diabetes. Type 1 diabetes affects the immune system's function as the system attacks the pancreas' insulin producing cells, also known as the beta cells. Because of this, the pancreas loses the ability to manufacture insulin. This is the reason why people with type 1 diabetes take insulin everyday. The symptoms are weight loss, increase in urination & thirst, blurred vision, tiredness and constant hunger. And if the adolescent isn't treated at the right time, he/she can slip in to diabetic coma which can endanger his/her life. In type 2 diabetes, the body is incapable of properly using the insulin produced by the body and requires insulin from an external source, too. The symptoms of type 2 diabetes are similar to type 1 diabetes. The teenager feels sick, tired, nauseated, and thirsty. The wounds will recover very slowly; he/she will get infections frequently, will develop blurred vision and will experience weight loss.

Parents play a vital role in determining the problem. They should constantly observe their child for eating disorders or signs of depression. Although cigarette, drugs and alcohol should be avoided by all adolescents and children, it is even more important that youngster with diabetes should stay away from these things as they can worsen the situation. A person with diabetes, who switches to smoking, is at risk of developing cardiovascular diseases and circulatory problems. Consumption of alcohol can cause hypoglycemia or low blood sugar. It is the duty of the parents to make their child aware of the possible risk they would face if they start to smoke, drink alcohol or take drugs.

Children and adolescents, who have diabetes, face many challenges while trying to lead a normal life. They have to think twice before doing simple things as going to a party, playing sports and even when staying over with friends. This is because they require to intake oral medication or insulin. Their blood sugar level must be checked many times through out the day. Also, at gatherings, they have to avoid many food items. Because of this they will feel different from the crowd and can feel left out. Not only does diabetes pose behavioral challenges, but also emotional challenges.

Analysis psychotherapy for people diagnosed with schizophrenia the

Diabetes is a disease where the human body is incapable of producing or utilizing insulin. Insulin is a hormone produced by the body in order to get energy by converting starches, sugar and other items. Since the insulin isn't used properly in diabetic people, the blood sugar level increases. This glucose buildup is found in blood and is then passed onto the urine and comes out of the body and the major source of body energy is lost.

Diabetes is a serious chronic disease and should be handled at proper time; otherwise it can create serious problems. It can pose a risk and can damage parts of the human body such as eyes, teeth, gums, blood vessels, nerves, and kidneys. This is the reason why diabetes is responsible in most of the cases of adult blindness, kidney failure and lower limb amputations. And if left untreated, it can cause stroke, heart disease and eventually, death. These problems are not only faced by adults, but also adolescents who get diabetes in their childhood. The important factor in treatment of diabetes is to keep the blood sugar level normal at all times.

Eye strain can be avoided by increasing the distance from the monitor.

Eye hazards are also caused when cosmetics are used improperly by contact lens wearers. Some of the adverse reactions are injury, eye irritation, allergy, dryness, infection, and lens deposition. That is the reason why adolescents must be made aware of the risk they will face when opting for contact lens. Girls should understand that they should buy hypoallergenic cosmetics and especially the non-scented variety, manufactured by big brand names. Cosmetics should not be shared with anything else. The applicator brushes must be washed regularly and old mascara must be disposed and not refilled. Acupuncture Can Help You Quit Smoking

Smoking is one hard habit to break. If nicotine patches and gum doesn't work, perhaps you should try something else like an alternative form of healthcare like acupuncture.

Acupuncture is an ancient practice involving the use of needles. This instrument is inserted into the skin to allow you energy or Qi to start flowing freely around your body and thus help you quit smoking.

When you go visit an acupuncturist for the first time and tell him or her that you want to quit smoking, after answering some questions, the specialist will carry out an examination of your ears and search for areas where the energy is low.

Curse psychotherapy for people diagnosed with schizophrenia the:Unfortunately, standards of acupuncture have not been fully approved by the FDA due to many unregulated practices that still exist such as the re-use of needles. Furthermore, acupuncture certification today is mostly a sham, used to make money on desperate patients who have not benefited from western medical treatments. The National Council Against Health Fraud has even declared acupuncture as an unproven means of treatment whose concepts of healing are primitive and false.

Should You Try It

One thing that Western science can agree upon is that there are no proven harmful effects of acupuncture. Many doctors agree that as long as a medication is not detrimental to ones health, then there is no reason why it should not be used if there are noticeable benefits. Most scientists would also state that it is simply due to a lack of research that the therapeutic properties of acupuncture have not yet been proven.

Acupuncture can help treat migraines. This was discovered after a comparative study was done with conventional medical care. In some cases, it even prevents it from happening which helps improve the quality of life for the patient.

To understand how acupuncture helps migraine sufferers, you have to understand that in traditional Chinese medicine, it is believed that an imbalance in the flow of blood and energy causes this to happen.

In order to treat it, the specialist must relieve the tension by inserting needles into the body to improve the blood flow to the brain thus reducing the pain experienced during an attack.

*observation psychotherapy for people diagnosed with schizophrenia the~*Acupuncture can do more than just helping patients deal with arthritis or migraine. Clinical tests have shown that it can help obese people lose weight and those who are suffering from insomnia.

As a result, various schools have been built and those who want to become licensed acupuncturists are now able to practice their profession.

Despite that, there were a lot of people who are not yet convinced on the positive effects of alternative forms of medication. It was only in 1995 that the US Food and Drug Administration decided to classify the needles used for acupuncture as medical instruments and assured the public that they are both safe and effective.

To further promote acupuncture, the NIH or National Institute of Health in 1997 has stated that this technique is very useful in treating various health conditions. These include ear, nose, throat, respiratory, gastrointestinal, eye, nervous system and muscular disorders. In some cases, acupuncture is able to prevent some of them from happening.

It seems that by simply starting to define one accounting term, it eventually leads to defining other terms as well. Net worth is another term that is quite difficult to understand. It refers to the resulting amount after deducting the liabilities of a company from the assets. Private companies refer to net worth as owner's equity.

Why owner's equity? Well, after deducting all the liabilities, what's left basically belongs to the owner. In the case of public companies, the profit of the business is returned as dividends to shareholders. As you can see, before owner or shareholders of a company can take hold of the profits, all liabilities must be deducted first.

Patients of acupuncture typically experience very minimal or no pain at all, however most of the points are located near nerve endings and muscle tissues. As the needles are embedded in the body, signals are sent to the brain thus promoting the release of endorphins from the pituitary gland.

There are also other points in the body that serve as gateways for better weight management. One of these placements promotes a decrease in an individual's appetite, while another has the ability to reduce water retention in the body. The acupuncturist may choose a multi-targeted approach, depending on the requirements of the patient.

The Skinny on Acupuncture Weight Loss

It has been found that weight gain is directly related to emotions. Other than physical hunger, people reach for a huge chocolate bar or a big platter of burger and fries because of the sense of comfort derived from food and eating.

More often than not, excessive weight gain is an emotional issue, rather than a mere physical one. You may not realize it, but you tend to take in more food whenever you're stressed, upset, or pressured.

In Acupuncture, there are specific spots on the body being targeted by the hair-like needles. These spots are linked to certain areas in the body and by stimulating these spots; the patient will achieve a greater sense of inner balance.

As these points are inserted by the needles, certain hormones are released throughout the body. These substances work by helping you manage hunger and efficiently control the impulse to overeat.

How Acupuncture Induces Weight Loss

Most acupuncturists will target the spots behind the ear when it comes to promoting weight loss. When these points behind the ear are stimulated, endorphins are released in large doses. Endorphins are called the feel-good hormones, and these are also often referred to as natural pain and fever relievers. The release of endorphins is what makes you feel better after an increased level of physical activity, as in the case of a good workout.

These bodily compounds allow the patient to experience better relaxation, thus considerably alleviating stress. There is a greater possibility of enhanced weight loss when the patient has already achieved emotional wellness.

Endorphins are also released whenever the body experiences low levels of bodily pain, thus their moniker as a natural pain reliever.

What is acupuncture?

Acupuncture has surged in popularity for the last few decades as brought on by the recent health trend. Mostly known as a traditional Chinese medical technique, acupuncture is seen as a homeopathic method of treatment. While alternative medicine does raise a lot of eyebrows for the scientifically-inclined, it does merit attention before being dismissed as a quack cure.

Basic Procedure

Basically, needles are inserted into the skin, each corresponding to one of the numerous pressure points located throughout the body. According to Traditional Chinese Medicine, by inserting a needle into the pressure point, an acupuncturist can manipulate the flow of chi or life force, thus relieving pain and gradually treating the patient. While most would say that the whole chi thing is a bunch of nonsense, science has suggested that with the needles inserted, the body's natural painkillers called endorphins are released, thus helping with pain relief.

Cholesterol in Adolescents

Parts of adolescent's body are filled with a waxy stuff identified as cholesterol. It helps to produce vitamin D, cell membranes and certain hormones. Blood cholesterol comes from two different sources, liver within the body and food. The adolescent's liver produces enough cholesterol to carry out proper functioning.

The blood acts as the carrier of cholesterol and transports it to different parts of the body. They are transported in round particle form known as lipoproteins. There are two types of lipoproteins called the low density lipoproteins or LDL and high density lipoproteins or HDL. Low density lipoprotein or LDL cholesterol is commonly known as bad cholesterol. It helps in the building up of plaque in arteries and this condition is known as atherosclerosis. The LDL level must be low in the blood and if it is high it must be decreased. Healthy weight must be maintained and exercise should be done regularly. Food items which have high contents of calories, dietary cholesterol and saturated fat must be avoided.

High density lipoprotein or HDL cholesterol is the good cholesterol. It is actually a kind of fat in blood which helps to remove bad cholesterol from the body and stops the build up of plaque in the arteries. The more the HDL cholesterol in the blood the better it is. The HDL can be raised by at least twenty minutes of exercising daily, decreasing body mass and keeping away from food with saturated fat. Some adolescents need to take medications in order to increase HDL. In such cases, increasing HDL can be a complicated procedure and the physician can make a therapeutic plan to increase HDL in the blood stream.
