Strategies to Improve Cardiac Arrest Survival Institute of Medicine 2015-09-29 Cardiac arrest can strike a seemingly healthy individual of any age, race, ethnicity, or gender at any time in any location, often without warning. Cardiac arrest is the third leading cause of death in the United States, following cancer and heart disease. Four out of five cardiac arrests occur in the home, and more than 90 percent of individuals with cardiac arrest die before reaching the hospital. First and foremost, cardiac arrest treatment is a community issue - local resources and personnel must provide appropriate, high-quality care to save the life of a community member. Time between onset of arrest and provision of care is fundamental, and shortening this time is one of the best ways to reduce the risk of death and disability from cardiac arrest. Specific actions can be implemented now to decrease this time, and recent advances in science could lead to new discoveries in the causes of, and treatments for, cardiac arrest. However, specific barriers must first be addressed. *Strategies to Improve Cardiac Arrest Survival* examines the complete system of response to cardiac arrest in the United States and identifies opportunities within existing and new treatments, strategies, and research that promise to improve the survival and recovery of patients. The recommendations of *Strategies to Improve Cardiac Arrest Survival* provide high-priority actions to advance the field as a whole. This report will help citizens, government agencies, and private industry to improve health outcomes from sudden cardiac arrest across the United States.

Valvular Heart Disease Marian C. Hawkey 2021-11-30 This book serves as the "go-to" resource for cardiovascular nurses and other health care practitioners involved in the care of patients with acquired valvular heart disease. It includes unique information about heart valve anatomy and pathophysiology, the complexity of clinical presentations and diagnostic evaluation, patient education and shared decision-making, surgical and transcatheter treatment options, and transition to palliative care. The content focuses primarily on the specialized care of patients with aortic stenosis and regurgitation, and mitral and tricuspid regurgitation. In addition, this unique resource provides timely information to guide a patient-centred and team-driven approach that reflects contemporary and innovative practice in the management of valvular heart disease. The essential topics of strengthening the multidisciplinary Heart Team and programmatic processes of care, the priorities for nursing care, and the multifactorial challenges of managing this complex patient population are explored in detail. Importantly, this resource aims to support all clinicians who are involved in the various timepoints of patients' full trajectory of care, from their evaluation pathway, admissions for treatment, and long term follow-up. Clinicians require contemporary knowledge and evidence to guide their practice, provide appropriate care for this complex patient population, and contribute to the advancement of practice. To date, there has been little emphasis placed on the management of valvular heart disease in cardiovascular nursing and allied health curriculum. This book fills this gap and addresses the pressing need for a user-friendly resource to guide the care for this growing population in a rapidly changing clinical environment. The editors are international leaders in the care and management of patients with acquired valvular heart disease and program development. They are widely recognized for their pioneering role in shaping the way we care for these patients.

The Future of Nursing Institute of Medicine 2011-02-08 *The Future of Nursing* explores how nurses' roles, responsibilities, and education should change significantly to meet the increased demand for care that will be created by health care reform and to advance improvements in America's increasingly complex health system. At more than 3 million in number, nurses make up the single largest segment of the health care

work force. They also spend the greatest amount of time in delivering patient care as a profession. Nurses therefore have valuable insights and unique abilities to contribute as partners with other health care professionals in improving the quality and safety of care as envisioned in the Affordable Care Act (ACA) enacted this year. Nurses should be fully engaged with other health professionals and assume leadership roles in redesigning care in the United States. To ensure its members are well-prepared, the profession should institute residency training for nurses, increase the percentage of nurses who attain a bachelor's degree to 80 percent by 2020, and double the number who pursue doctorates. Furthermore, regulatory and institutional obstacles-including limits on nurses' scope of practice-should be removed so that the health system can reap the full benefit of nurses' training, skills, and knowledge in patient care. In this book, the Institute of Medicine makes recommendations for an action-oriented blueprint for the future of nursing.

Congenital Heart Disease Serena Francesca Flocco 2018-12-07 This book provides the theoretical and practical basis of technical nursing in congenital heart disease; it is intended for nurses and nursing students, and for anyone involved in the treatment of these patients. The improvements in diagnosis and management of patients with congenital heart disease (CHD) are due to the recent advances in cardiac surgery and interventional cardiology and have meant that an increasing number of infants are reaching adolescence and adulthood. This manual is a practical and easy-to-use guide, which promotes effective cooperation between health professionals. Congenital heart disease is a disorder that is present at birth, and studies show that the incidence is around eight cases per thousand live births. The heart is formed during the first four - ten weeks of gestation, and alterations to this process can affect normal development, leading to heart defects. There are various types of heart defects: abnormalities that affect a single part of the heart (for example a valve) but also, highly complex abnormalities where there is severe damage to the cardiac architecture. The seriousness of the disease and the effects on child health vary: some forms have no real impact on child health and allow a normal life, while others are incompatible with life.
