*True-Integrating Environmental Noise Monitor and Sound Exposure Level Meter. Volume I. User's Guide* P. D. Schomer 1978 This report summarizes desirable features and factors in environmental noise monitors, in general, and in particular, monitors which measure the impulsive noise created by military sources. Particular emphasis is placed on the need to have a true-integrating detector to properly measure these impulsive sources. Based on these needs, a noise monitor has been designed and constructed. This report summarizes the operations and components of this monitoring unit. Volume II describes the construction, parts lists, layouts, and schematics of the monitoring unit. (Author).

**Quieting: A Practical Guide to Noise Control** Raymond D. Berendt 2000-09 This guide offers practical solutions for ordinary noise problems that a person is likely to meet. The book describes the ways in which sounds are generated, travel to the listener, and affect his hearing and well-being. Recommendations are given for controlling noise at the source and along its path of travel, and for protecting the listener. This guide instructs the reader by way of "Warning Songs" on how to determine whether he is being subjected in his environment to prolonged noise exposures that may prove hazardous to his hearing. Remedies are given for noise problems that a person is likely to find in his home, at work and at school, while traveling, and in the growth and development of his community. The remedies include noise prevention techniques and selection of quiet alternatives to existing noise sources. General principles for selecting quiet appliances are given. Ways of searching for the sources of noise and for determining the paths over which they travel to the listener are described. A detailed index is given for individual ways of looking for inherently quiet homes and travel accommodations are described. In a final chapter, there are suggestions for enlisting community help where large external sources of noise must be quieted, such as those arising from public utilities and public transportation.

**User's Manual** 1982 "This manual presents the operation of the Barrier Cost Reduction (BCR) procedure. The FHWA Level 2 Noise Prediction Model (STAMINA 1.0) has been modified to calculate the sound energy passing over several barrier segment heights in one run. The information is then used in an interactive program (OPTIMA) which can guide the user to the most efficient noise barrier design. The user is shown, step-by-step, how to input information and to interpret the output results for both STAMINA and OPTIMA"--Technical report documentation page.

*Noise Control Manual* David A. Harris 2013-03-09 Excessive noise levels are generally acknowledged to have adverse effects on our environment. Studies indicate that excessive noise levels can cause fatigue in exposed individuals, lower efficiency and productivity, impaired speech communication, and hearing loss. Excessive noise is almost everywhere today - in the office, in schools, hospitals and other institutional facilities, in all classes of public buildings, and in our factories. INDUSTRIAL NOISE High noise levels in factories can make speech communication in the plant difficult and at times impossible. Foremen are often unable to hear warning shouts from co-workers. The problem of hearing loss due to excessive noise exposure is of particular concern to industry, and to the federal government. In the early 1970s, the United States Congress passed the Occupational Safety and Health Act (OSHA) which sets criteria for health hazards and established limits for noise exposure of industrial workers. The OSHA Noise Standard was amended in 1982 to require audiometric testing of all employees exposed to noise levels of 85 dB or above for eight hours. A NOISE IN COMMERCIAL AND INSTITUTIONAL BUILDINGS While noise levels in offices, stores, schools, and other commercial and institutional buildings seldom reach those encountered in many industrial environments, they often reach levels which are distracting to the occupants of such buildings. Impairment of speech communication among workers, or inversely the lack of speech privacy, are both deterrents to efficiency and productivity and are detrimental to the occupants' comfort and sense of well-being.

**Tucker-Davis Technologies Power DAC User's Guide** 1996 This guide outlines the basic operation of the Tucker-Davis Technologies system for studying three-dimensional sound imaging. The system consists of a convolver system (Power DAC) to mount various sound spatializing algorithms, a number of auxiliary signal processing and conditioning modules (System II) which facilitate the presentation of acoustic stimuli to subjects, and a host computer with supporting software. Information is included on system installation and set-up, basic programming issues, hardware initialization, set-up and use of functions, playing raw binary sound files, double buffering and playback of long sound files, using Power DAC hardware, Power DAC set-up, routing schedule set-up, running and stopping the Power DAC, and three-dimensional audio using the Power DAC. The appendix includes programming examples.
