The chapter starts with a conversation on the traits of groups and periods, clarifying how the Russian chemist Mendeleev organized elements by their weight in ascending order¹. It then explores the notion of outer electrons and levels of energy of atoms, highlighting the function of these electrons in chemical reactions and transformations to atomic structures and molecular structures.

The chapter moreover separates between transition metals and main elements, expounding on their features and traits. It also clarifies the concept of ionization energy and its patterns among groupings and periodic groups on the periodic table¹. The chapter discusses atom’s and radii, and how these can be anticipated based on an element’s location on the periodic table.

The concept of electronegativity, which measures an element’s propensity to pull a bonding pair of electrons, is another important topic covered in this chapter¹. The chapter finishes with a discussion on the diagonal relationship, character of metals, and boiling point of components.

In terms of exercises, the chapter provides a array of questions for practice and standardized test preparation resources to strengthen the notions learned. These exercises cover a array of themes, from grasping the organization of constituents to investigating the tendencies in the periodic table.
