The chapter begins with a dialogue on the characteristics of groups and periodic groups, clarifying how the Russian chemist Dmitri Mendeleev arranged elements by their weight in ascending order<sup>1</sup>. It then dives into the concept of outer electrons and levels of energy of atoms, emphasizing the function of valence electrons in chemical reactions and alterations to atoms.

The chapter further distinguishes between transition elements and main group elements, expounding on their features and attributes. It also describes the concept of ionization energy and its trends among groupings and periods on the periodic table. The chapter discusses atomic sizes and radii, and how these can be predicted based on an element's place on the table of elements.

Electronegativity, which calculates an atom's propensity to draw a bonding pair of electrons, is another key subject discussed in this part. The chapter ends with a dialogue on the relationship diagonally, metallic character, and boiling point of constituents.
