Chapter four of the Holt Chemistry textbook, titled "Periodic Table", provides a thorough look of the periodic table and its constituents. The chapter opens with a conversation on the characteristics of groupings and periodic groups, elucidating how Russian chemist Dmitri Mendeleev organized elements by their atomic weight in ascending order<sup>1</sup>. It then delves into the idea of outer electrons and levels of energy of atoms, underscoring the part of valence electrons in chemical reactions and changes to atomic structures and molecular structures.

The chapter further differentiates between transition metals and main group elements, expounding on their properties and characteristics. It also clarifies the idea of energy of ionization and its trends among groupings and periodic groups on the table of elements<sup>1</sup>. The chapter discusses atomic and radii, and how these can be anticipated based on an element's location on the periodic table.

The concept of electronegativity, which measures an element's propensity to draw a bonding pair of electrons, is another crucial theme covered in this chapter<sup>1</sup>. The chapter ends with a discussion on the diagonal relationship, character of metals, and boiling point of constituents.
