Turbulent Shear Layers in Supersonic Flow 2006-05-11 Alexander J. Smits A good understanding of turbulent compressible flows is essential to the design and operation of high-speed vehicles. Such flows occur, for example, in the external flow over the surfaces of supersonic aircraft, and in the internal flow through the engines. Our ability to predict the aerodynamic lift, drag, propulsion and maneuverability of high-speed vehicles is crucially dependent on our knowledge of turbulent shear layers, and our understanding of their behavior in the presence of shock waves and regions of changing pressure. Turbulent Shear Layers in Supersonic Flow provides a comprehensive introduction to the field, and helps provide a basis for future work in this area. Wherever possible we use the available experimental work, and the results from numerical simulations to illustrate and develop a physical understanding of turbulent compressible flows.

Mystery of the Missing Diamond

It was a gloomy and tempestuous night. The drizzle was falling heavily, and the gale was roaring. In the heart of the city, there was a museum, where a precious diamond was on display. The diamond was known as the Star of Africa, and it was the biggest and most stunning diamond in the globe. It was protected by a advanced security mechanism, and a team of equipped guards. No one could rob it, or so they thought. But somebody did. An individual succeeded to bypass the protection, to avoid the watchmen, to smash the glass, and to steal the diamond. And no one observed them, no one heard them, no one recognized who they were. They exited no sign, no hint, no testimony. They faded into the darkness, with the Star of Africa. And the mystery of the vanished diamond began.
