The chapter starts with a dialogue on the traits of groupings and periods, elucidating how Russian chemist Dmitri Mendeleev arranged elements by their weight in increasing order<sup>1</sup>. It then explores the idea of valence electrons and energy levels of atoms, emphasizing the function of these electrons in chemical reactions and alterations to atomic structures and molecular structures.

The chapter moreover differentiates between transition metals and main group elements, expounding on their characteristics and attributes. It also describes the idea of ionization energy and its trends among groupings and periods on the table of elements<sup>1</sup>. The chapter converses about atomic and ionic, and how these can be forecasted based on an element’s location on the periodic table.

The concept of electronegativity, which measures an element’s inclination to pull a bonding pair of electrons, is another crucial subject covered in this chapter<sup>1</sup>. The chapter ends with a dialogue on the relationship diagonally, character of metals, and boiling point of components.
