Beyond Implementation: A Prescription for Lasting Emr Adoption Heather Annette Haugen 2010-05-01 Despite the significant benefits of electronic medical records, organizations continue to struggle with successful technology adoption. Beyond Implementation examines the primary reason for poor and failed EMR adoption, explores real-world results from large healthcare organizations, and reveals a new approach for successful adoption and lasting value. The authors, Dr. Heather Haugen and Dr. Jeffrey Woodside, have witnessed the outcomes of poor adoption and are committed to helping organizations successfully adopt an EMR system. Through actual case studies and research, the book investigates the barriers that keep physicians from making EMR part of their routines. The key premise: a myopic focus on go-live implementation impedes the adoption and long-term sustinament of EMR.

Registries for Evaluating Patient Outcomes Agency for Healthcare Research and Quality/AHRQ 2014-04-01 This User's Guide is intended to support the design, implementation, analysis, interpretation, and quality evaluation of registries created to increase understanding of patient outcomes. For the purposes of this guide, a patient registry is an organized system that uses observational study methods to collect uniform data (clinical and other) to evaluate specified outcomes for a population defined by a particular disease, condition, or exposure, and that serves one or more predetermined scientific, clinical, or policy purposes. A registry database is a file (or files) derived from the registry. Although registries can serve many purposes, this guide focuses on registries created for one or more of the following purposes: to describe the natural history of disease, to determine clinical effectiveness or cost-effectiveness of health care products and services, to measure or monitor safety and harm, and/or to measure quality of care. Registries are classified according to how their populations are defined. For example, product registries include patients who have been exposed to biopharmaceutical products or medical devices. Health services registries consist of patients who have had a common procedure, clinical encounter, or hospitalization. Disease or condition registries are defined by patients having the same diagnosis, such as cystic fibrosis or heart failure. The User's Guide was created by researchers affiliated with AHRQ's Effective Health Care Program, particularly those who participated in AHRQ's DEiDE (Developing Evidence to Inform Decisions About Effectiveness) program. Chapters were subject to multiple internal and external independent reviews.
