Dairy Microbiology Handbook Richard K. Robinson

2005-03-11 Throughout the world, milk and milk products are indispensable components of the food chain. Not only do individual consumers use liquid milk for beverages and cooking, but food manufacturers use vast quantities of milk powder, concentrated milks, butter, and cream as raw materials for further processing. Effective quality assurance in the dairy industry is needed now more than ever. This completely revised and expanded Third Edition of Dairy Microbiology Handbook, comprising both Volume I: Microbiology of Milk and Volume II: Microbiology of Milk Products, updates the discipline's authoritative text with the latest safety research, guidelines, and information. Pathogens have become a major issue in dairy manufacturing. *Escheria coli* is a concern, and milk-borne strains of *Mycobacterium avium* sub-sp. *paratuberculosis* have been identified as a possible cause of Crohn's disease. Even little-known parasites like *Cryptosporidium* have caused disease outbreaks. Consequently, a hazard analysis of

selected control/critical points (HACCP) in any manufacturing process has become essential to prevent the contamination of food. This volume also: -Discusses new diagnostic techniques that allow a pathogen to be detected in a retail sample in a matter of hours rather than days -Provides thorough coverage of dairy microbiology principles as well as practical applications -Includes the latest developments in dairy starter cultures and genetic engineering techniques -Offers completely updated standards for Good Manufacturing Practice Quality control and product development managers, microbiologists, dairy scientists, engineers, and graduate students will find the Third Edition of Dairy Microbiology Handbook to be a vital resource.

Alternatives for Landmine Detection Jacqueline MacDonald Gibson 2003 At the rate that government and nongovernmental organizations are clearing existing landmines, it will take 450-500 years to rid the world of them. Concerned about the slow pace of demining, the Office of Science and Technology asked RAND to assess potential innovative technologies being explored and to project what funding would be required to foster the development of the more promising ones. The authors of this report suggest that the federal government undertake a research and development effort to develop a multisensor mine detection system over the next five to eight years.
